

DIHWorld Audio Customer Quick Guide

Current: 2026-10-04

Website documentation: <https://dihworldaudio.com/#documentation>

What this guide is

This is the condensed customer guide for the current DIHWorld Audio documentation package. It combines the repeated start-here, feature-language, dot-protocol, routing, sidechain, and meter notes into one short reference.

The complete manual remains the main authority. Use this guide when you need the fastest orientation.

Install and open

- macOS customers use the current signed and notarized AU for Logic Pro, or VST3 for compatible VST3 hosts.
- Windows customers use only the supplied 64-bit VST3 beta when a Windows beta package is provided.
- Close the DAW before installing or rescanning.
- Do not mix historical installers with the current package.
- Open the website documentation hub if you need the newest links: <https://dihworldaudio.com/#documentation>

Safe first audition

Start simple:

1. Put one DIHWorld plugin on one track or one bus. 2. Start with the source near -18 dB. 3. Turn on Gain Match when comparing processed and bypassed sound. 4. Keep no more than three active DIH processors on one track or bus unless you are deliberately designing a special chain. 5. If the sound gets better only because it is louder, lower the output and compare again.

Core DIH terms

Term	Meaning	What to listen for
DIH Engine	Shared signal foundation across the plugins.	Controlled level behavior, stable routing, and family-specific movement.
DIH Guard	Protection and canon-compliance layer.	Fewer unsafe jumps, cleaner output, and safer preset changes.
Momentum Bend	Subtle motion curve.	Movement without obvious pitch-warping.
Phi Ceiling	DIH intensity ceiling based on the phi relationship.	Controlled intensity; not a loudness target.
Gain Match	Level-fair comparison switch.	Processed and bypassed comparisons without volume bias.
Preset Smoothing	Clickless transition behavior.	Presets should change without pops, clicks, or sudden jumps.

DIH dots

DIH dots are quick placement and status indicators.

Dot state	Meaning
Bright or glowing	The current role or placement is active or confirmed.
Dim	The role is available but inactive.
Slow pulse	Check placement or signal conditions.
Flashing warning	Check level, phase, sidechain, routing, or clipping before printing.

Color language:

The color-dot legend describes DIH family and placement roles. It does not describe the SILVER and GOLD microphone products. For vocal decisions, SILVER is the neutral M50 reference baseline; GOLD is the optional color microphone, compared at equal loudness.

- Gold: source tone / vocal-first role.
- Blue: bus, group, or parallel placement.
- Silver: mastering or polish.
- Purple: spatial depth or placement.
- Red-orange: saturation, color, amp, or tape.
- Green: analysis, metering, or advisor.
- Cyan: dynamics, transient, or guard.
- White: utility, safety, or protection.

Routing basics

Use DIHWorld plugins intentionally. Typical paths:

- Vocal source: source-tone plugin -> dynamics/protection -> color or spatial processor.
- Drum bus: transient or glue processor -> color if needed -> bus/output check.
- Bass bus: low-end support -> dynamics pocket if needed -> output check.
- FX return: spatial or movement processor -> Gain Match -> output check.
- Master/print bus: only final-stage polish, balance, or observation tools.

For detailed routing, open:

- DIHWorld_Template_Starter_Pack_CURRENT.pdf
- Website routing section: <https://dihworldaudio.com/#documentation>

Sidechain basics

Sidechain-capable plugins use the host DAW sidechain menu. The sidechain signal controls detection, ducking, motion, pocket, or balance behavior. It is not mixed into the audible output by the plugin.

Current documented sidechain roster:

Plugin	Use
ANUBIS	Gate/expander key and ducking.
TEHUTI	Low/mid/high spectral ducking.
MARIANA	Key-controlled low-end layer.
MONOLITH	Key-controlled low-frequency pocket.
NTRPL	Keyed rewrite-layer pocket.
DrumKrushGlue	Drum-bus impact/glue key.
SacredVerb	Wet-only reverb and Solfeggio return ducking.

For the current wet-return / spatial sidechain path, use **SacredVerb**.

Meters and visualizers

Meters and visualizers observe the signal. They do not improve the audio by themselves.

Use them to confirm:

- Input is present.
- Output is controlled.
- Gain reduction, ducking, or gate pressure is actually happening.
- Sidechain activity is reaching the plugin.
- Width, correlation, or field motion is safe.

If a visualizer looks active but the sound does not change, check Power, Mix, Output, Gain Match, sidechain routing, and whether the relevant engine is enabled.

Customer-safe note

DIHWorld feature names describe audio engineering, creative signal behavior, routing, visual feedback, and level protection. Frequency, harmonic, geometry, and symbolic terms describe creative tuning or signal organization. They are not medical, therapeutic, or healing claims.
